+66 65 807 1545 (Thailand) · +1 250 692 0239 (Canada) · North Vancouver, Canada & Bangkok, Thailand
Born May 1986 / 40yo · Canadian–Thai dual citizen · English (Fluent) · French (Fluent) · Thai (Professional)

I untangle complex, high-stakes systems: legacy monoliths, fragmented platforms, ERP and e-commerce rewrites other teams couldn't finish, and turn them into something that scales. Pulled authentication for 20,000+ merchants out of a Rails monolith with no cutover, so a payments core handling ~100M transactions a day could scale horizontally; collapsed three codebases into one platform running a 9-node white-label network on any domain. 15+ years, full stack, hands on.

Skills (years)

Experience

Technical Lead — CrashPad411

Feb 2024 – Jan 2026 · Full-time · Remote (USA) · crashpad411.com

- **CrashPad411** is the #1 rental listings site for airline crew. As technical lead I owned the architecture across all six repositories and wrote about 1,400 of the 2,600+ commits.
- **Payments overhaul.** **Situation:** The payments engine deleted its own failed transactions, so the books literally could not be reconciled with Stripe; customers were double-charged, and chargebacks ran higher than the base subscription fee, thousands of dollars a month. **Task:** Make payments trustworthy. **Action:** Rebuilt users, payments and subscriptions from scratch around webhooks, idempotency and an auditable ledger, adding Stripe Connect payouts and AutoPay rent collection. **Result:** The ledger ties out against Stripe, double charges stopped, chargebacks came under control, and the operator reads month-end from an admin dashboard instead of asking an engineer.
- **Three codebases into one.** **Situation:** Three white-label apps (Comeback, CrashPad411 and POGO) each had their own users, login and payments APIs. **Task:** Remove the duplication. **Action:** Merged them into one service-based Laravel monolith (600+ routes, OpenAPI 3). **Result:** About 70% less backend code and 60% lower hosting costs.
- **White-label network on any domain.** **Situation:** Each brand (ComebackApp, CrashPad411, POGO, NurseHousing247) needed its own look and content, and launching a site meant manual server work. **Task:** Make a new branded site something you can launch on demand. **Action:** White-labeled the app so every node has its own theme, styling and content, each running as its own instance and talking to the others through OAuth client-credentials grants over REST. Wrote Azure DevOps pipelines that launch an instance on any custom domain end to end (infrastructure, Key Vault secrets, DNS and SSL, containers, migrations, nightly backups), plus a self-service onboarding portal where customers sign up and pay through Stripe (Python/Bottle, Vue 3, MongoDB). **Result:** A 9-node network off one codebase, where opening a new site is a pipeline run, not a new build.
- **First CI/CD.** **Situation:** Deploys meant editing files on the server by hand, and an API gateway with no written config crashed and took production down shortly after I joined. **Task:** Restore service and end manual deploys. **Action:** Brought production back up live, then built the company's first CI/CD (GitLab to DigitalOcean, later Azure DevOps) with containerized deploys on self-hosted Docker agents. **Result:** No more hand-edited deploys, and dev builds became essentially free.
- **Logging and alerting.** **Situation:** There was no way to know what was wrong with the application without logging into the server and reading the error logs by hand. **Task:** Make failures visible. **Action:** Built custom logging and error reporting through a log service, with email notifications, alerts and dashboards. **Result:** The team now gets emails, alerts and dashboards the moment something goes wrong, instead of digging through server logs.

- **Full-stack upgrade.** **Situation:** The platform was on Vue 2, PHP 7 and Laravel 8. **Task:** Upgrade the whole stack. **Action:** Migrated to Vue 3 (SSR on Express), PHP 8 and Laravel 11 using AI tooling backed by purpose-built Cypress tests. **Result:** Finished in months instead of the year it was expected to take.
- **Mobile-first rebuild.** **Situation:** The site had poor mobile design and wasn't responsive in many places, the admin portal was dated, and several React Native apps overlapped. **Task:** Rebuild the UI. **Action:** Redesigned and hand-coded the new web frontend from the ground up, mobile-first; led 6 developers rebuilding the admin portal; merged the React Native apps into one. **Result:** A responsive site on every device and a single iOS / Android app to maintain.
- **AI support assistant.** **Situation:** Customers kept needing help using the product. **Task:** Reduce the support load. **Action:** Added an AI assistant through an MCP server on the listings API: chatbot, listing recommendations, content generation and settings help. **Result:** Support requests dropped.

Tech: PHP 8 · Laravel 11 · MySQL · Vue 3 (SSR / Express) · React Native · Python / Bottle · MongoDB · Stripe / Stripe Connect · OAuth 2.0 (client credentials) · AWS S3 · WebSockets · Laravel Nova / Horizon · Cypress · Docker · GitLab CI · Azure DevOps · DigitalOcean · MCP · Claude

Senior Software Engineer · Tech Lead, Single Sign-On — Opn / Omise

Apr 2021 – Mar 2024 · Full-time · Bangkok, Thailand · omise.co

- One of South-East Asia's largest payment gateways: US\$19B+ processed, 20,000+ merchants (BMW, McDonald's Thailand, King Power, True, Pomelo), running directly against banks and card rails in PCI scope. I was the sole lead on company-wide single sign-on, and one of the lead engineers, rotating across three products: Merchant Dashboard, Payment Links+ and UMay+.
- **Single sign-on to scale payments core.** **Situation:** Payments core could only scale horizontally on sticky sessions, because authentication lived inside the Rails monolith: users pinned to one node meant uneven load and sessions lost whenever a node restarted or failed over, and user lookups piled N+1 queries onto payment requests. On top of that, 8 platforms and dozens of apps had each grown their own login, each new one costing roughly a developer's worth of auth work, and the same customer existed several times over across systems. **Task:** Move users out of the monolith into one company-wide identity, progressively, without a big-bang cutover or an enterprise licence. **Action:** Championed open-source Keycloak across divisions despite pushback, and built its custom extensions: a hybrid federated user store that served users from the old systems while moving them out progressively and de-duplicating identities in place, plus claim mappers, branded themes and DataDog monitoring; token verification moved to Istio sidecars at the API layer. **Result:** Moved the logins of 20,000+ merchants out of the monolith with no cutover, so payments core, handling ~100M transactions a day, dropped sticky sessions and the user-related N+1 queries, and scaled cleanly across nodes. One login across 8 platforms and dozens of apps, about 60% fewer login support tickets, no Red Hat licence fees, and still in production.
- **Legacy sessions without breaking merchants.** **Situation:** Merchants' live API tokens were tied to old Rails sessions. **Task:** Move them onto OIDC without breaking a single integration. **Action:** New to Rails, I built a gRPC bridge Keycloak called on every login, backed by a distributed Infinispan cache and auto-scaling Kubernetes nodes. **Result:** No merchant integration broke. In JMeter tests complete OAuth / OIDC flows, redirects included, stayed sub-second at about 300 per second per node (1,800 across the A/B failover domains); nodes took far more at slower response times.
- **Payment Links+ and Merchant Dashboard v2.** **Situation:** Merchants needed to take payments through shareable links, invoices and receipts they could drop into websites, chats, emails and social DMs, and a modern dashboard to manage customers and transactions. **Task:** As the team's senior engineer, build both products. **Action:** Built across all three Payment Links+ apps (merchant, admin and system admin) and Merchant Dashboard v2, a Stripe-style dashboard for customers, receipts and transactions (React, Next.js, GraphQL, Node / Express). **Result:** Both in production for Omise's merchants, and among the products the single sign-on unified.
- **UMay+ virtual cards.** **Situation:** Merchants needed virtual credit cards. **Task:** Build the product's frontend. **Action:** Built the whole UMay+ frontend end to end and contributed to its Go / gRPC backend, with KYC identity checks and OTP verification in PCI scope. **Result:** In production for Omise's merchants.
- **Running it at payments scale.** **Situation:** The login service sat on the critical path of a platform citing 99.99% availability and ~100M transactions a day, while Keycloak itself moved from WildFly to Quarkus and from version 15 to 23. **Task:** Keep it up through all of it. **Action:** Owned CI/CD and GitOps (Kubernetes, Helm, FluxCD, Istio, Buildkite) with blue-green deploys across A/B failover domains, built and watched DataDog, Grafana, Prometheus and Kibana dashboards, and upgraded incrementally. **Result:** The SSO ran within the 99.99% target, and every upgrade shipped with no production downtime.

Tech: Java · Keycloak (WildFly / Quarkus) · Infinispan · gRPC / protobuf · Ruby on Rails · Go · React · Next.js · GraphQL · Node / Express · Kubernetes · Helm · FluxCD · Istio · Buildkite · DataDog · Grafana · Prometheus · Kibana · JMeter

Senior Full-Stack Engineer — Frontend Apps Lead — CGI — BC Provincial Government

Nov 2019 – Apr 2021 · Full-time · Victoria, BC · names.bcregistry.gov.bc.ca · fom.nrs.gov.bc.ca

- Embedded with BC government ministries (Service BC, BC Registries, Justice and Attorney General, Forests) as what's now called a forward-deployed engineer: scoping work on-site with ministry teams and CGI's architects, then building it. Frontend Apps Lead across the projects, owning frontend architecture and the Agile backlog. All open source: ~1,593 commits and 179 PRs across 6 bcgov repos.
- **Name Request / NameX. Situation:** B.C. has complex rules for business names (required distinctive and descriptive elements, restricted words, conflicts with existing names), and most new businesses in a province of 500,000+ must get their name approved by BC Registries before they can register. **Task:** As lead developer, build the engine that examines names against those rules, and the public app people use to request one. **Action:** Built the synonyms API and Python client, machine-learning word classification (PyTorch) on top of Solr search, extra-provincial name handling, name-conflict analysis, credit-card payments, and NATS event queues driving state changes and email notifications (Python / Flask, PyTorch, Postgres, Solr, Keycloak; Vue). **Result:** In production as the province's public Name Request service: business-name rejections fell 95%, and customer support response throughput improved 70%.
- **Sheriff scheduling. Situation:** B.C.'s Sheriff Service, about 600 deputy sheriffs across 90 court locations, needed one system to schedule them. **Task:** Lead development of the scheduling app for the Ministry of Justice and Attorney General. **Action:** Built roles and auth, admin, sheriff locations and the scheduling components, with UTC cross-timezone date handling and Liquibase migrations (React + API), as top frontend committer with 847 commits. **Result:** Delivered the province-wide scheduling app for the Sheriff Service.
- Also senior developer on the public Forest Operations Map for BC Forestry (Keycloak, OpenShift).
- Recommended on LinkedIn: "Lucas's work ethic, ability to create innovative solutions using cutting edge technologies make him a valuable asset to any team." — Lorna Trent, my client at Service BC

Tech: Python · Flask · Marshmallow · PyTorch · Postgres · Solr · NATS · Vue.js · React · TypeScript · Node.js · Java · Keycloak · Liquibase · OpenShift · Jenkins · Kubernetes

Senior SWE / Frontend Apps Lead — Agereh Technologies Inc.

Jul 2017 – Feb 2019 · Full-time · Edmonton, AB · agereh.com

- An AI and intelligent-infrastructure company, known as Carbeeza until September 2025 and listed on the TSX as AUTO.
- **First products before funding. Situation:** The startup needed its first products built ahead of its first funding round. **Task:** Lead the frontend. **Action:** Led the frontend team building the consumer portal and dealership / finance apps (TypeScript, React) on Node / RabbitMQ microservices against a Java / Spring Boot API, containerized on OpenShift. **Result:** Shipped through the startup's first funding round.
- **Lean containers. Situation:** The frontend containers on OpenShift were heavy, which slowed image pulls and autoscaling. **Task:** Make them cheaper to run and scale. **Action:** Rebuilt the images on small base images and containerized every frontend app the same way. **Result:** Faster pulls and autoscaling, more pods per node, and a smaller attack surface.

Tech: TypeScript · React · Node.js / Express · RabbitMQ · Docker · OpenShift · Java / Spring Boot · Swagger / OpenAPI

Solutions Developer — Caffe Tech

Jul 2015 – Jul 2017 · Full-time · Edmonton, AB · caffetech.com

- **Off Magento, onto the books. Situation:** Another firm left the Magento store half-built; staff found Magento hard to use, and none of the QuickBooks plugins we tried worked. **Task:** Get the store running and connected to the books. **Action:** Fixed and upgraded the Magento store and wrote its Purolator and Global Payments extensions, then moved the business to OpenCart with a complete QuickBooks Online integration through a REST API I built on Doctrine ORM. **Result:** The store and the books stayed in sync, and staff could run the store themselves.
- **POS for the shops. Situation:** Caffe Tech's shops across Edmonton needed a till that printed tickets and kitchen orders for staff and tied into the online store. **Task:** Build it. **Action:** Built a POS and QR menu ordering system in React and Cordova on the same REST API. **Result:** In-store and online orders ran through one system.
- **Inventory. Situation:** A 5,000–10,000-part inventory had never been catalogued. **Task:** Get it under control. **Action:** Catalogued every part into QuickBooks and rebuilt the chart of accounts. **Result:** Stock quantities reconciled for tax records.

- Also built Canada Post and Purolator shipping with thermal labels, and ran the office IT (Microsoft SBS, Windows, Parallels).

Tech: PHP · Magento · OpenCart · Slim · Doctrine ORM · MySQL · React · Redux · Cordova · QuickBooks Online API · SOAP · Microsoft SBS

Software Engineer (Level 3) — Alberta Motor Association

Feb 2013 – Dec 2014 · Full-time · Edmonton, AB · ama.ab.ca

- **AgentView rewrite.** **Situation:** A previous contractor's rewrite of AMA's insurance system had failed. **Task:** Rebuild it with a 6–7-person team. **Action:** Rewrote the client and services, built a Kendo UI JavaScript framework to render the huge vehicle-insurance forms, worked on the CGI AutoPlus, Kanetix and Equifax integrations, and hardened the Web API / WCF contracts. **Result:** AgentView serves AMA's several million policyholders in Alberta, and agents handle claim calls 30–50% faster.
- **Mobile quotes.** **Situation:** The old home and auto insurance quote apps didn't work on phones. **Task:** Make quoting work on mobile. **Action:** Rebuilt both quote apps as responsive JavaScript clients on ASP.NET Web API. **Result:** Customers could get quotes on any device.

Tech: JavaScript · Kendo UI · jQuery · Require.js · C# · ASP.NET Web API · WCF · Entity Framework · SQL Server · SOAP · TFS

Full-Stack Engineer — Carsgone.com

May 2011 – Oct 2012 · Full-time · Edmonton, AB · carsgone.com

- **Virtual dealership.** **Situation:** Dealer inventory arrived as large nightly feeds in different formats. **Task:** Build a used-car marketplace on top of them. **Action:** With Strathcom Media, built the app and API (PHP / Kohana) and a multi-threaded parser that normalized the feeds into Sphinx. **Result:** Fast search across syndicated dealer inventory.

Tech: PHP · Kohana / CodeIgniter · MySQL · Sphinx · ImageMagick · SOAP · XML-RPC

Selected live work & open source

- Live systems: crashpad411.com · omise.co/en/payment-links-plus · vcard.issuing.opn.ooo · linksplus.omise.co · names.bcregistry.gov.bc.ca · fom.nrs.gov.bc.ca · caffetech.com
- Open source: ~1,593 commits / 179 PRs across 6 BC-government repos as github.com/bcdevlucas — e.g. github.com/bcgov/jag-shuber-frontend (847), github.com/bcgov/jag-shuber-api (380), github.com/bcgov/namex (226) — plus 50+ public repos at github.com/bluecollardev (my QuickCommerce platform in PHP · C# · Python; Mediashare in TypeScript).

Side projects - Founder / Principal Web Developer - Blue Collar Development

2007–2026 · Thailand / Canada · bluecollardev.com

- My personal web-development consultancy — custom websites, mobile + web apps, e-commerce and CRM / ERP solutions, for clients across Thailand, China, the UK and Canada. (Some open source work at github.com/bluecollardev). Full client list and recommendations in the Appendix.
- **Skin Tyee First Nation (2026, 3-month contract).** **Situation:** After a disaster, a First Nation band's technology had to be rebuilt from scratch, and it had no way to run community services digitally. **Task:** Act as temporary domain architect and build the apps. **Action:** Set up hardware, network, Entra ID logins and roles, Azure, data sovereignty and encryption, and disaster-recovery policy and testing; built a role-gated React Native community app, a Consultation Referrals system with PostGIS maps, and a contract-first NestJS API on Azure Container Apps. **Result:** A secured environment with tested disaster recovery, and the apps delivered within the contract.
- **Award-winning job board.** **Situation:** RMG Selection, a recruitment firm in Beijing, needed a job board candidates and clients would actually use. **Task:** Design and build it. **Action:** Built a responsive WordPress site with a custom Job Board extension, a multi-language jobs component, CV uploads and a mobile site with automatic device detection. **Result:** It won Best Job Board at the Global Recruiter Asia Pacific Awards, and RMG kept me on directly from 2009 to 2014.
- **PocketPT.** **Situation:** Dr. Adam Fehr needed one place to keep his exercise videos and send a patient a whole session at once. **Task:** Build it end to end. **Action:** Built PocketPT: a React Native / Expo app, four NestJS microservices in an Nx monorepo over MongoDB, AWS Cognito, S3 and Lightsail, and GitLab CI. **Result:** Patients get sessions as playlists from ~1,000 instructional videos, and the stack became the foundation for the Skin Tyee community app.

Appendix — Side Projects & Freelance Work in Thailand

Expanded detail behind the Blue Collar Development entry. From 2006 to 2011 I was based in Bangkok, running my own web-development consultancy, subcontracting for local agencies (Smart Traffic Australia, SoftControl / Infinity IT Success), and building a hardware business on the side. I kept the consultancy running after moving to Canada in 2011, with clients there and abroad.

Founder / Principal Web Developer — Blue Collar Development (Thailand)

2007 – 2026 · International clients · bluecollardev.com

- Designed and built websites, e-commerce stores, custom CMS builds and extensions on Joomla, WordPress, Magento, OpenCart and Zen Cart with PHP / MySQL back-ends. Built my own OpenCart-based commerce platform, QuickCommerce (github.com/bluecollardev), and reused it across client projects.
- Dr. Adam Fehr / PocketPT (2020–present)** [HEALTH](#) PocketPT, a video-sharing platform Dr. Fehr uses to send patients exercise sessions as playlists from ~1,000 instructional videos: React Native / Expo app, four NestJS microservices in an Nx monorepo over MongoDB, AWS Cognito / S3 / Lightsail and GitLab CI. Live at app.drafehr.com.
- Phobulous Noodle House, Edmonton (2017)** [RESTAURANT](#) custom Asian-styled restaurant site built as a React single-page app with CSS animations and a custom menu component, on a headless OpenCart backend exposed over REST (PHP, Slim, Doctrine).
- Jimmy Poblano's Mexican Cantina, Edmonton (2017)** [RESTAURANT](#) restaurant and food-truck site with fully custom artwork and parallax scrolling, a React single-page app on headless OpenCart. I also helped run the food truck.
- Baan Saowanee, Ko Samui (2016)** [HOSPITALITY](#) mobile-friendly single-page site for a collection of holiday-home rentals near Mae Nam Beach, with parallax effects, animated page transitions and a customized OpenCart build for content.
- Vest Racing (2015)** [MOBILE APP](#) hybrid tablet / phone app built on my QuickCommerce platform, subcontracted through Phase 3 Development.
- RMG Selection, Beijing (2009–2014)** [RECRUITMENT](#) responsive WordPress site and a custom Job Board extension that won Best Job Board at the Global Recruiter Asia Pacific Awards; also a multi-language jobs component, CV upload and a WURFL-based mobile site. Started via Smart Traffic, then continued directly.
- Spasation, Alberta (2011)** [E-COMMERCE](#) website and online store for a chain of spas and salons: a responsive OpenCart theme and a custom Canada Post shipping extension.
- Active 24 / Visma, Oslo (2011)** [WEB HOSTING](#) WordPress plugin for hosting-product matrices: an Excel-style WYSIWYG editor with inline AJAX editing, cell overrides and a style editor.
- Infinity IT Success (formerly SoftControl), Bangkok (2010–2011)** [E-COMMERCE](#) custom Magento plugins, plus subcontracted work for ExtremeAudio (Germany): QA and debugging of its Magento car-audio store and custom extensions (AJAX product search, admin event hooks, price-range categories).
- Xtend-Life Natural Products, Christchurch NZ + Bangkok (2010)** [E-COMMERCE](#) storefronts across OpenCart and ASP.NET MVC, plus an affiliate marketing platform (auto-generated WordPress MU sites with an ASP.NET MVC admin) and a 300 dpi business-card publishing plugin.
- Smart Traffic Australia, Bangkok (2009–2010)** [E-COMMERCE](#) subcontracted e-commerce builds, mostly OpenCart and WordPress. MyFoneRecycle (UK): a strict-MVC overhaul of OpenCart's core with one-step checkout, customer rewards and batch product actions. Also Gorilla Print (UK) and a wholesale silver-jewelry store with a Thai e-Pay payment-gateway integration.
- Binc BKK VFX (2009)** [FILM & MEDIA](#) website plus a client-management and asset-tracking database for the Bangkok visual-effects studio, and several prototyping collaborations.
- HDF Mercy Centre, Bangkok (2009)** [NON-PROFIT](#) Joomla blog-style site for mercycentre.org with an integrated phpBB forum and a custom AJAX event-management system.
- Kantana Group, Bangkok (2009)** [FILM & MEDIA](#) the Khan Kluay animated-feature movie site and the Kantana Animation Studios site; a media-rich Joomla interface launched with the release of Khan Kluay 2.
- R1 Club, Bangkok (2008)** [LUXURY](#) website and custom Joomla-based CMS for a South-East Asian luxury-services members' club (sister site to Luxe Galleria).
- Luxe Galleria, Bangkok (2008)** [LUXURY](#) Joomla site for the Luxe Galleria TV network covering luxury events (e.g. at Siam Paragon): a Flash-based media manager, a custom video / picture showcase plugin, blogs, forums, RSS and media downloads.
- Bangkok 2008 Film Festival (2008)** [FILM & MEDIA](#) media-heavy festival site with streaming media, Flash galleries and multi-language translation.
- Global Renewable Energy Services, California (2008)** [COMMUNITY](#) Joomla community portal for a California biofuels think-tank: file sharing, document management, forums and Facebook integration.

- **DP Piranha (2007)** [E-COMMERCE](#) heavily modified Joomla / Zen Cart store for automotive accessories, with a redesigned database for faster search and bulk product management.

Tech: HTML, CSS, jQuery, React, Flash, PHP, Slim, Doctrine, Joomla, WordPress / WordPress MU, Magento, OpenCart (incl. headless), Zen Cart, phpBB, MySQL, ASP.NET MVC, SQL Server, Apache

Founder — Siam Automated Vending Co., Ltd.

2006 – 2010 · Bangkok, Thailand

- Founded and ran one of Thailand's early automated-vending businesses, when vending machines were almost non-existent in the market: importing, distribution, sales and operations.
- Imported Fuji Electric machines and converted their transformers to Thai voltage / frequency standards; integrated MEI and Nayax coin mechanisms, bill acceptors and cashless payment hardware, and programmed them to accept Thai baht.
- The venture closed, but it helped prove local demand. Fuji Electric later set up manufacturing in Thailand.

Client recommendations (LinkedIn and bluecollardev.com)

- **Brynley Cadman, Binc BKK VFX** — "Lucas designed our current website and database for client management and asset tracking. We have also collaborated on several prototyping projects where his participation was enthusiastic and his contributions were innovative and valued."
- **Dirk Scholtholt, Enterprise Architect, Active 24 / Visma** — "Working with Lucas was a positive experience. His work was of high standard and met my expectations. His high availability made working with him across timezones easy. I would hire him again for similar tasks."
- **Danny A., Director, Spasation** — "I would highly recommend Blue Collar!"
- **Leigh Wells, P.Eng., Phase 3 Development (Vest Racing)** — "His technical skills are great, and he is a creative problem solver. What really impressed me was his work ethic; never have I encountered a developer with a drive like Lucas'. He was routinely working all hours of the night to meet a client deadline, with no complaints."
- **Greg Lane, owner, Jimmy Poblano's Mexican Cantina** — "Lucas designed and implemented an amazing website for our business this year... We've seen an immediate increase in sales and flow through business, we have engaged our customers in new ways... I would definitely engage Lucas for our next project."
- **Dr. Adam Fehr, MD, DPT, PocketPT** — "Lucas is very patient, attentive to detail, and works hard to ensure my needs/concept is met. He has also been willing to go well beyond what I would reasonably expect."
- **James W. L. Alexander, media broker** — "I would highly recommend Lucas."
